SOME NEW SERIES FOR $1/\pi$ MOTIVATED BY CONGRUENCES

ZHI-WEI SUN

ABSTRACT. In this paper, via symbolic computation we deduce a family of six new series for $1/\pi$, for example,

$$\sum_{n=0}^{\infty} \frac{41673840n + 4777111}{5780^k} W_n\left(\frac{1444}{1445}\right) = \frac{147758475}{\sqrt{95}\pi}$$

where $W_n(x) = \sum_{k=0}^n \binom{n}{k} \binom{n+k}{k} \binom{2k}{k-k} \binom{2(n-k)}{n-k} x^k$. In addition, we pose 17 new series for $1/\pi$ motivated by congruences; for example, we conjecture that

$$\sum_{k=0}^{\infty} \frac{4290k+367}{3136^k} \binom{2k}{k} T_k(14,1)T_k(17,16) = \frac{5390}{\pi},$$

where $T_k(b,c)$ is the coefficient of x^k in the expansion of $(x^2 + bx + c)^k$.

1. INTRODUCTION

Let $n \in \mathbb{N} = \{0, 1, 2, ...\}$. In 1894 J. Franel [8] introduced the usual Franel numbers $f_n = \sum_{k=0}^n {n \choose i}^3$ $(n \in \mathbb{N})$ and the Franel numbers $f_n^{(4)} = \sum_{k=0}^n {n \choose k}^4$ $(n \in \mathbb{N})$ of order four. By the Zeilberger algorithm (cf. [9]), the sequence $(f_n^{(4)})_{n\geq 0}$ satisfies the following recurrence first claimed by Franel:

$$(n+2)^3 f_{n+2}^{(4)} = 4(1+n)(3+4n)(5+4n)f_n^{(4)} + 2(3+2n)(7+9n+3n^2)f_{n+1}^{(4)}$$

M. Rogers and A. Straub [11] confirmed the suthor's conjectural series for $1/\pi$ involving Franel polynomials.

In 2005 Y. Yang used mofular forms of level 10 to discover the following curious identity relating Franel numbers of order four to Ramanujan-type series for $1/\pi$:

$$\sum_{k=0}^{\infty} \frac{4k+1}{36^k} f_k^{(4)} = \frac{18}{\sqrt{15}\pi}$$

More this kind of identities were deduced by S. Cooper [4] in 2012 via modular forms. For the classical Ramanujan-type series for $1/\pi$, one may consult [1, 2, 10] and the nice survey given by Cooper [5, Chapter 14].

Key words and phrases. Ramanujan-type series for $1/\pi$, congruences, binomial coefficients, symbolic computation.

For $n \in \mathbb{N}$ the polynomial

$$W_n(x) = \sum_{k=0}^n \binom{n}{k} \binom{n+k}{k} \binom{2k}{k} \binom{2(n-k)}{n-k} x^k$$
$$= \sum_{k=0}^n \binom{n+k}{2k} \binom{2k}{k}^2 \binom{2(n-k)}{n-k} x^k$$

at x = -1 coincides with $(-1)^n f_n^{(4)}$, this can be easily verified since the sequence $((-1)^n W_n(-1))_{n\geq 0}$ satisfies the same recurrence as $(f_n^{(4)})_{n\geq 0}$. In 2011 the author [12, (3.1)-(3.10)] proposed ten identities of the form

$$\sum_{k=0}^{\infty} \frac{ak+b}{m^k} W_k\left(\frac{1}{m}\right) = \frac{C}{\pi},$$

where a, b, m are integers with $am \neq 0$, and C^2 is rational. They were later confirmed in [6].

In this paper we establish six new series for $1/\pi$ involving $W_n(x)$.

Theorem 1.1. We have the following identities:

$$\sum_{k=0}^{\infty} \frac{45k+8}{40^k} W_k\left(\frac{9}{10}\right) = \frac{215\sqrt{15}}{12\pi},\tag{1.1}$$

$$\sum_{k=0}^{\infty} \frac{1360k + 389}{(-60)^k} W_k\left(\frac{16}{15}\right) = \frac{205\sqrt{15}}{\pi},\tag{1.2}$$

$$\sum_{k=0}^{\infty} \frac{735k+124}{200^k} W_k\left(\frac{49}{50}\right) = \frac{10125\sqrt{7}}{56\pi},\tag{1.3}$$

$$\sum_{k=0}^{\infty} \frac{376380k + 69727}{(-320)^k} W_k\left(\frac{81}{80}\right) = \frac{260480\sqrt{5}}{3\pi},\tag{1.4}$$

$$\sum_{k=0}^{\infty} \frac{348840k + 47461}{1300^k} W_k\left(\frac{324}{325}\right) = \frac{1314625\sqrt{2}}{12\pi},\tag{1.5}$$

$$\sum_{k=0}^{\infty} \frac{41673840k + 4777111}{5780^k} W_k\left(\frac{1444}{1445}\right) = \frac{147758475}{\sqrt{95}\pi}.$$
 (1.6)

We also have 9 conjectural series for $1/\pi$ involving $W_n(x)$ as listed in the following conjecture.

Conjecture 1.1. We have the following identities:

$$\sum_{k=0}^{\infty} \frac{4k+1}{6^k} W_k\left(-\frac{1}{8}\right) = \frac{\sqrt{72+42\sqrt{3}}}{\pi},$$
 (1.7)

$$\sum_{k=0}^{\infty} \frac{392k+65}{(-108)^k} W_k\left(-\frac{49}{12}\right) = \frac{387\sqrt{3}}{\pi},\tag{1.8}$$

$$\sum_{k=0}^{\infty} \frac{168k+23}{112^k} W_k\left(\frac{63}{16}\right) = \frac{1652\sqrt{3}}{9\pi},\tag{1.9}$$

$$\sum_{k=0}^{\infty} \frac{1512k + 257}{(-320)^k} W_k\left(-\frac{405}{64}\right) = \frac{1184\sqrt{35}}{5\pi},\tag{1.10}$$

$$\sum_{k=0}^{\infty} \frac{56k+9}{324^k} W_k\left(\frac{25}{4}\right) = \frac{1134\sqrt{35}}{125\pi},\tag{1.11}$$

$$\sum_{k=0}^{\infty} \frac{13000k - 1811}{(-1296)^k} W_k\left(-\frac{625}{9}\right) = \frac{49356\sqrt{39}}{5\pi},\tag{1.12}$$

$$\sum_{k=0}^{\infty} \frac{9360k - 1343}{1300^k} W_k\left(\frac{900}{13}\right) = \frac{21515\sqrt{39}}{3\pi},\tag{1.13}$$

$$\sum_{k=0}^{\infty} \frac{56355k + 2443}{(-5776)^k} W_k\left(-\frac{83521}{361}\right) = \frac{4669535\sqrt{2}}{68\pi},\tag{1.14}$$

$$\sum_{k=0}^{\infty} \frac{5928k + 253}{5780^k} W_k\left(\frac{1156}{5}\right) = \frac{28951\sqrt{2}}{4\pi}.$$
 (1.15)

Remark 1.1. Note that the left-hand sides of (1.1)-(1.15) have the form $\sum_{k=0}^{\infty} (ak+b)W_k(x)/m^k$ with mx an integer square. Motivated by congruences, the author found (1.1)-(1.15) during August 23-29, 2020.

van Hamme [20] thought that classical Ramanujan-type series for $1/\pi$ should have their *p*-adic analogues involving the *p*-adic Gamma function. This does not hold in general for generalized Ramanujan-type series, for example, the author [13, Conjecture 1.5] discovered the identity

$$\sum_{n=0}^{\infty} \frac{6n-1}{256^n} \binom{2n}{n} \sum_{k=0}^n \binom{2k}{k}^2 \binom{2(n-k)}{n-k} 12^{n-k} = \frac{8\sqrt{3}}{\pi}$$

(which was later confirmed in [6]) and conjectured its related p-adic congruence

$$\sum_{n=0}^{p-1} \frac{6n-1}{256^n} \binom{2n}{n} \sum_{k=0}^n \binom{2k}{k}^2 \binom{2(n-k)}{n-k} 12^{n-k} \equiv -p \pmod{p^2}$$

(with p any prime greater than 3) which has noting to do with the Legendre symbol $\left(\frac{-3}{p}\right)$.

ZHI-WEI SUN

For the author's philosophy to generate series for $1/\pi$ via congruences, one may consult the survey [13] and the recent paper [18, Section 1].

We will prove Theorem 1.1 in the next section, and present related conjectural congruences in Section 3. In Section 4-6, we will pose 8 other new conjectural series for $1/\pi$ motivated by congruences.

2. Proof of Theorem 1.1

Lemma 2.1. For $|z| \le 1/30$, we have

$$\sum_{k=0}^{\infty} \frac{z^k}{(1+4z)^{k+1}} W_k\left(\frac{1}{1+4z}\right) = \sum_{n=0}^{\infty} f_n^{(4)} z^n \tag{2.1}$$

and

$$\sum_{k=0}^{\infty} \frac{kz^k}{(1+4z)^{k+1}} W_k\left(\frac{1}{1+4z}\right) = \sum_{n=0}^{\infty} n(f_n^{(4)} + 4s_n)z^n, \qquad (2.2)$$

where

$$s_n := \sum_{0 \le j < n} (-1)^{n-1-j} \binom{n-1}{j} \binom{n+j}{j} \binom{2j}{j} \binom{2(n-1-j)}{n-1-j}.$$
 (2.3)

Proof. Let N be any nonnegative integer. Then

$$\begin{split} &\sum_{k=0}^{N} \frac{z^{k}}{(1+4z)^{k+1}} W_{k} \left(\frac{1}{4z+1}\right) \\ &= \sum_{k=0}^{N} z^{k} \sum_{j=0}^{k} \binom{k+j}{2j} \binom{2j}{j}^{2} \binom{2(k-j)}{k-j} (1+4z)^{-j-k-1} \\ &= \sum_{k=0}^{N} z^{k} \sum_{j=0}^{k} \binom{k+j}{2j} \binom{2j}{j}^{2} \binom{2(k-j)}{k-j} \sum_{r=0}^{\infty} \binom{-j-k-1}{r} (4z)^{r} \\ &= \sum_{n=0}^{\infty} z^{n} \sum_{k=0}^{\min\{n,N\}} \sum_{j=0}^{k} \binom{k+j}{2j} \binom{2j}{j}^{2} \binom{2(k-j)}{k-j} \binom{-j-k-1}{n-k} 4^{n-k} \\ &= \sum_{n=0}^{\infty} z^{n} \sum_{j=0}^{\min\{n,N\}} \binom{2j}{j}^{2} \sum_{k=j}^{\min\{n,N\}} \binom{k+j}{2j} \binom{2(k-j)}{k-j} \binom{n+j}{k+j} (-4)^{n-k} \\ &= \sum_{n=0}^{\infty} z^{n} \sum_{j=0}^{\min\{n,N\}} (-4)^{n-j} \binom{2j}{j}^{2} \binom{n+j}{2j} \sum_{k=j}^{\min\{n,N\}} \binom{n-j}{k-j} \binom{2(k-j)}{(-4)^{k-j}}. \end{split}$$

Similarly,

$$\sum_{k=0}^{N} \frac{kz^{k}}{(1+4z)^{k+1}} W_{k}\left(\frac{1}{4z+1}\right)$$
$$= \sum_{n=0}^{\infty} z^{n} \sum_{j=0}^{\min\{n,N\}} (-4)^{n-j} {\binom{2j}{j}}^{2} {\binom{n+j}{2j}} \sum_{k=j}^{\min\{n,N\}} k {\binom{n-j}{n-k}} \frac{{\binom{2(k-j)}{k-j}}}{(-4)^{k-j}}.$$

Clearly $\binom{2m}{m} \leq (1+1)^{2m} = 4^m$ for all $m \in \mathbb{N}$. Thus

$$\left|\sum_{k=j}^{\min\{n,N\}} \binom{n-j}{k-j} \frac{\binom{2(k-j)}{k-j}}{(-4)^{k-j}}\right| \le \sum_{k\ge j} \binom{n-j}{k-j} = 2^{n-j}$$

and hence

$$\left| \sum_{j=0}^{\min\{n,N\}} (-4)^{n-j} {\binom{2j}{j}}^2 {\binom{n+j}{2j}} \sum_{k=j}^{\min\{n,N\}} {\binom{n-j}{k-j}} \frac{{\binom{2(k-j)}{k-j}}}{(-4)^{k-j}} \right|$$

$$\leq \sum_{j=0}^{\min\{n,N\}} 4^n {\binom{n+j}{2j}} {\binom{2j}{j}} 2^{n-j} \leq 8^n \sum_{j=0}^n {\binom{n}{j}} {\binom{n+j}{j}} \left(\frac{2-1}{2}\right)^j = 8^n P_n(2),$$

where

$$P_n(x) = \sum_{k=0}^n \binom{n}{k} \binom{n+k}{k} \left(\frac{x-1}{2}\right)^k$$

is the Legendre polyomial of degree n. Similarly,

$$\Big|\sum_{j=0}^{\min\{n,N\}} (-4)^{n-j} {2j \choose j}^2 {n+j \choose 2j} \sum_{k=j}^{\min\{n,N\}} k {n-j \choose n-k} \frac{{2(k-j) \choose k-j}}{(-4)^{k-j}}$$

$$\leq \sum_{j=0}^{\min\{n,N\}} 4^n {n+j \choose 2j} {2j \choose j} \min\{n,N\} 2^{n-j} \leq n8^n P_n(2).$$

By the Laplace-Heine formula (cf. [19, p. 194]),

$$P_n(2) \sim \frac{(2+\sqrt{3})^{n+1/2}}{\sqrt{2n\pi}\sqrt[4]{3}}$$
 as $n \to +\infty$.

As $8(2 + \sqrt{3}) < 29.86$, we have $n8^n P_n(2) < 30^n$ if n is sufficiently. Recall that |z| < 1/30.

In view of the above,

$$\lim_{N \to +\infty} \sum_{k=0}^{N} \frac{z^{k}}{(1+4z)^{k}} W_{k} \left(\frac{1}{1+4z}\right)$$

$$= \lim_{N \to +\infty} \sum_{n=0}^{N} z^{n} \sum_{j=0}^{n} (-4)^{n-j} {\binom{2j}{j}}^{2} {\binom{n+j}{2j}} \sum_{k=j}^{n} {\binom{n-j}{n-k}} {\binom{-1/2}{k-j}}$$

$$= \sum_{n=0}^{\infty} z^{n} \sum_{j=0}^{n} (-4)^{n-j} {\binom{2j}{j}}^{2} {\binom{n+j}{2j}} {\binom{n-j-1/2}{n-j}}$$

$$= \sum_{n=0}^{\infty} z^{n} \sum_{j=0}^{n} {\binom{n+j}{2j}} {\binom{2j}{j}}^{2} {\binom{2(n-j)}{n-j}} (-1)^{n-j}$$

$$= \sum_{n=0}^{\infty} z^{n} (-1)^{n} W_{n} (-1) = \sum_{n=0}^{\infty} f_{n}^{(4)} z^{n}.$$

Similarly,

$$\begin{split} \lim_{N \to +\infty} \sum_{k=0}^{N} \frac{kz^k}{(1+4z)^k} W_k \left(\frac{1}{1+4z}\right) &- \sum_{n=0}^{\infty} nf_n^{(4)} z^n \\ &= \lim_{N \to +\infty} \sum_{n=0}^{N} z^n \sum_{j=0}^{n} (-4)^{n-j} \binom{2j}{j}^2 \binom{n+j}{2j} \sum_{k=j}^{n} (k-n) \binom{n-j}{n-k} \binom{-1/2}{k-j} \\ &= -\sum_{n=0}^{\infty} z^n \sum_{j=0}^{n} (-4)^{n-j} \binom{2j}{j}^2 \binom{n+j}{2j} (n-j) \sum_{j \le k < n} \binom{n-j-1}{n-k-1} \binom{-1/2}{k-j} \\ &= -\sum_{n=0}^{\infty} z^n \sum_{j=0}^{n} (-4)^{n-j} (n-j) \binom{n}{j} \binom{n+j}{j} \binom{2j}{j} \binom{n-j-3/2}{n-j-1} \\ &= \sum_{n=0}^{\infty} nz^n \sum_{0 \le j < n} 4^{n-j} \binom{n-1}{j} \binom{n+j}{j} \binom{2j}{j} \binom{-1/2}{n-j-1} \\ &= \sum_{n=0}^{\infty} nz^n \sum_{0 \le j < n} (-1)^{n-j-1} 4\binom{n-1}{j} \binom{n+j}{j} \binom{2j}{j} \binom{2(n-j-1)}{n-j-1}. \end{split}$$

So we have the desired result.

Lemma 2.2. For any $n \in \mathbb{N}$ we have

$$5n(4n+1)((n+2)s_{n+2} - 16ns_n) = (30n^3 + 54n^2 + 7n - 2)f_{n+1}^{(4)} + 2(60n^3 + 58n^2 + 17n + 2)f_n^{(4)}.$$
(2.4)

Proof. Let u_n denote the left-hand side or the right-hand side of (2.4). Via the Zeilberger algorithm, we find that

$$(1+n)(3+n)^{3}(5+4n)u_{n+2}$$

$$\times (344+2572n+8198n^{2}+13329n^{3}+10875n^{4}+4190n^{5}+600n^{6})$$

$$=2(2+n)(9+4n)P(n)u_{n+1}+4(1+n)(2+n)(3+4n)(5+4n)(9+4n)Q(n)u_{n}$$
for all $n = 0, 1, 2, ...,$ where

$$P(n) = 62208 + 506208n + 1799416n^2 + 3578972n^3 + 4250502n^4 + 3104119n^5 + 1401609n^6 + 380700n^7 + 56940n^8 + 3600n^9$$

and

$$Q(n) = 40108 + 127005n + 164335n^2 + 110729n^3 + 40825n^4 + 7790n^5 + 600n^6.$$

Note also that $u_0 = 0$, $u_1 = 2150$ and $u_2 = 103680$. As both sides of (2.4) give the same integer sequence $(u_n)_{n\geq 0}$, we have (2.4) as desired.

Now we are able to present an auxiliary theorem.

Theorem 2.3. Let a, b and x be complex numbers with $|x-1| \ge 7.5$. Then

$$\frac{10}{x}(x-1)^2(x-2)\sum_{n=0}^{\infty}\frac{an+b}{(4x)^n}W_n\left(1-\frac{1}{x}\right)$$

=
$$\sum_{k=0}^{\infty}(2ax(5x-7)k+a(10x-13)+10b(x-1)(x-2))\frac{f_k^{(4)}}{(4x-4)^k}.$$
 (2.5)

Proof. Note that $|1/(4x-4)| \le 1/30$. Applying (2.1) with z = 1/(4x-4), we get

$$\sum_{n=0}^{\infty} \frac{1}{(4x)^n} W_n\left(1 - \frac{1}{x}\right) = \frac{x}{x-1} \sum_{k=0}^{\infty} \frac{f_k^{(4)}}{(4x-4)^k}.$$
 (2.6)

If we have

$$\sum_{n=0}^{\infty} \frac{n}{(4x)^n} W_n\left(1-\frac{1}{x}\right) = \frac{x}{10(x-1)^2(x-2)} \sum_{k=0}^{\infty} \frac{(10x-14)(kx+1)+1}{(4x-4)^k} f_k,$$
(2.7)

then combining (2.6) with (2.7) we immediately get (2.5). The identity (2.7) is equivalent to the following one with z = 1/(4x - 4):

$$5(1-4z)\sum_{k=0}^{\infty} \frac{kz^k}{(1+4z)^{k+1}} W_k\left(\frac{1}{1+4z}\right)$$

= $\sum_{k=0}^{\infty} ((5-8z)(1+4z)k + 4z(5-6z))f_k z^k.$ (2.8)

Below we prove (2.8) for $|z| \leq 1/30$. For convenience, we write $[z^m]f(z)$ with $m \in \mathbb{N}$ to denote the coefficient of z^m in the power series expansion of f(z).

By Lemmas 2.1, for any $n \in \mathbb{N}$ we have

$$[z^{n+1}](1-16z^2) \sum_{k=1}^{\infty} \frac{kz^{k-1}}{(1+4z)^{k+1}} W_k\left(\frac{1}{1+4z}\right)$$
$$= [z^{n+2}](1-16z^2) \sum_{m=0}^{\infty} m(f_m^{(4)}+4s_m)z^m$$
$$= (n+2)(f_{n+2}^{(4)}+4s_{n+2}) - 16n(f_n^{(4)}+4s_n)$$
$$= (n+2)f_{n+2}^{(4)} - 16nf_n^{(4)} + 4((n+2)s_{n+2} - ns_n).$$

Now let $n \in \mathbb{Z}^+$. By the recurrence of $(f_m^{(4)})_{m \ge 0}$, we have $4n(4n+1)(4n-1)f_{n-1}^{(4)} = (n+1)^3 f_{n+1}^{(4)} - 2(2n+1)(3n^2+3n+1)f_n^{(4)}$ and hence

$$n(4n+1)((32n+52)f_{n+1}^{(4)} + (96n+56)f_n^{(4)} - 32(4n-1)f_{n-1}^{(4)})$$

=4n(4n+1)(8n+13)f_{n+1}^{(4)} + 8n(4n+1)(12n+7)f_n^{(4)}
-8(n+1)^3f_{n+1}^{(4)} + 16(2n+1)(3n^2+3n+1)f_n^{(4)}
=4(30n³ + 54n² + 7n - 2)f_{n+1}^{(4)} + 8(60n^3 + 58n^2 + 17n + 2)f_n^{(4)}
=20n(4n+1)((n+2)s_{n+2} - ns_n)

with the aid of Lemma 2.2. Combining this with the last paragraph, we get

$$[z^{n+1}]5(16z^2 - 1)\sum_{k=1}^{\infty} \frac{kz^{k-1}}{(1+4z)^{k+1}} W_k\left(\frac{1}{1+4z}\right)$$

= $-5(n+2)f_{n+2}^{(4)} + 80nf_{n+1}^{(4)} - 20((n+2)s_{n+2} - ns_n)$
= $-5(n+2)f_{n+2}^{(4)} + 80nf_{n+1}^{(4)} - (32n+52)f_{n+1}^{(4)}$
 $- (96n+56)f_n^{(4)} + 32(4n-1)f_{n-1}^{(4)}$
= $[z^{n+1}](32z^2 - 12z - 5)\left(4\sum_{k=0}^{\infty} (k+1)f_kz^k + \sum_{k=1}^{\infty} kf_kz^{k-1}\right)$
 $- [z^{n+1}](32z^2 + 8z)\sum_{k=0}^{\infty} f_kz^k$

In view of (2.2),

$$5(16z^{2} - 1) \sum_{k=1}^{\infty} \frac{kz^{k-1}}{(1+4z)^{k+1}} W_{k} \left(\frac{1}{1+4z}\right)$$
$$= 5(16z^{2} - 1) \sum_{m=1}^{\infty} m(f_{m}^{(4)} + 4s_{m})z^{m-1}$$
$$= 5(16z^{2} - 1)(6 + 68z + 900z^{2} + \ldots) = -30 - 340z - 4020z^{2} - \ldots$$

Combining this with the final result in the last paragraph, we find that

$$5(16z^2 - 1)\sum_{k=1}^{\infty} \frac{kz^{k-1}}{(1+4z)^{k+1}} W_k\left(\frac{1}{1+4z}\right)$$
$$= (4z+1)(8z-5)\left(4\sum_{k=0}^{\infty} (k+1)f_k z^k + \sum_{k=1}^{\infty} kf_k z^{k-1}\right) - 8z(4z+1)\sum_{k=0}^{\infty} f_k z^k$$

and hence

$$5(4z-1)\sum_{k=1}^{\infty} \frac{kz^{k-1}}{(1+4z)^{k+1}} W_k\left(\frac{1}{1+4z}\right)$$
$$=(8z-5)\left(4\sum_{k=0}^{\infty} (k+1)f_k z^k + \sum_{k=1}^{\infty} kf_k z^{k-1}\right) - 8z\sum_{k=0}^{\infty} f_k z^k.$$

This yields the desired (2.8).

The proof of Theorem 2.3 is now complete.

Proof of Theorem 1.1. In light of Theorem 2.3, we have

$$\sum_{k=0}^{\infty} \frac{45k+8}{40^k} W_k\left(\frac{9}{10}\right) = \frac{1075}{72} \sum_{k=0}^{\infty} \frac{4k+1}{36^k} f_k^{(4)},$$

$$\sum_{k=0}^{\infty} \frac{1360k+389}{(-60)^k} W_k\left(\frac{16}{15}\right) = \frac{9225}{32} \sum_{k=0}^{\infty} \frac{4k+1}{(-64)^k} f_k^{(4)},$$

$$\sum_{k=0}^{\infty} \frac{735k+124}{200^k} W_k\left(\frac{49}{50}\right) = \frac{10125}{784} \sum_{k=0}^{\infty} \frac{60k+11}{196^k} f_k^{(4)},$$

$$\sum_{k=0}^{\infty} \frac{376380k+69727}{(-320)^k} W_k\left(\frac{81}{80}\right) = \frac{5209600}{243} \sum_{k=0}^{\infty} \frac{17k+3}{(-324)^k} f_k,$$

$$\sum_{k=0}^{\infty} \frac{348840k+47461}{1300^k} W_k\left(\frac{324}{325}\right) = \frac{1314625}{243} \sum_{k=0}^{\infty} \frac{65k+9}{1296^k} f_k^{(4)},$$

$$\sum_{k=0}^{\infty} \frac{41673840k+4777111}{5780^k} W_k\left(\frac{1444}{1445}\right) = \frac{147758475}{1444} \sum_{k=0}^{\infty} \frac{408k+47}{5776^k} f_k^{(4)}.$$

By S. Cooper [4],

$$\sum_{k=0}^{\infty} \frac{4k+1}{36^k} f_k^{(4)} = \frac{6\sqrt{15}}{5\pi}, \quad \sum_{k=0}^{\infty} \frac{4k+1}{(-64)^k} f_k^{(4)} = \frac{32\sqrt{15}}{45\pi},$$
$$\sum_{k=0}^{\infty} \frac{60k+11}{196^k} f_k^{(4)} = \frac{14\sqrt{7}}{\pi}, \quad \sum_{k=0}^{\infty} \frac{17k+3}{(-324)^k} f_k = \frac{81\sqrt{5}}{20\pi},$$
$$\sum_{k=0}^{\infty} \frac{65k+9}{1296^k} f_k^{(4)} = \frac{81\sqrt{2}}{4\pi}, \quad \sum_{k=0}^{\infty} \frac{408k+47}{5776^k} f_k^{(4)} = \frac{76\sqrt{95}}{5\pi}.$$

So we have the desired (1.1)-(1.6). This concludes the proof.

ZHI-WEI SUN

3. Congruences related to the identities (1.1)-(1.15)

In [13, Section 3] the author introduced the polynomials

$$S_n(x) = \sum_{k=0}^n \binom{n}{k}^4 x^k \quad (n = 0, 1, 2, \ldots)$$
(3.1)

and made conjectures on $\sum_{k=0}^{p-1} S_k(x)$ modulo p^2 (with p an odd prime) for each integer x among the numbers

$$1, -2, \pm 4, -9, 12, 16, -20, 36, -64, 196, -324, 1296, 5776.$$

See also [17, Conjectures 49-51].

Theorem 1.1 and its proof are actually motivated by our following conjecture.

Conjecture 3.1. Let p be an odd prime. Then, for any p-adic integer $x \neq 0 \pmod{p}$ we have

$$\sum_{k=0}^{p-1} \frac{1}{(4x)^k} W_k\left(1 - \frac{1}{x}\right) \equiv \sum_{k=0}^{p-1} S_k(4x - 4) \pmod{p}.$$
 (3.2)

When

$$x \in \left\{2, \pm \frac{5}{4}, \pm 4, 5, 10, -15, 50, -80, 325, 1445\right\},$$

we have the further congruence

$$\sum_{k=0}^{p-1} \frac{1}{(4x)^k} W_k\left(1 - \frac{1}{x}\right) \equiv \sum_{k=0}^{p-1} S_k(4x - 4) \pmod{p^2}.$$
 (3.3)

The identity (1.1) is motivated by the following conjecture on related congruences.

Conjecture 3.2. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{10^{n-1}}{4n} \sum_{k=0}^{n-1} (45k+8) 40^{n-1-k} W_k\left(\frac{9}{10}\right) \in \mathbb{Z}^+$$

(ii) Let $p \not 2, 5$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{45k+8}{40^k} W_k\left(\frac{9}{10}\right) \equiv \frac{p}{16} \left(129\left(\frac{-15}{p}\right) - 1\right) \pmod{p^2}.$$

When $\left(\frac{-15}{p}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{45k+8}{40^k} W_k\left(\frac{9}{10}\right) - p \sum_{k=0}^{p-1} \frac{45k+8}{40^k} W_k\left(\frac{9}{10}\right)$$

divided by $(pn)^2$ is a p-adic integer.

The identity (1.2) is motivated by the following conjecture on related congruences.

Conjecture 3.3. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{15^{n-1}}{n} \sum_{k=0}^{n-1} (1360k + 389)(-60)^{n-1-k} W_k\left(\frac{16}{15}\right) \in \mathbb{Z}^+.$$

(ii) Let p > 5 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{1360k + 389}{(-60)^k} W_k\left(\frac{16}{15}\right) \equiv \frac{p}{2} \left(779 \left(\frac{-15}{p}\right) - 1\right) \pmod{p^2}.$$

When $\left(\frac{-15}{p}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{1360k+389}{(-60)^k} W_k\left(\frac{9}{10}\right) - p \sum_{k=0}^{p-1} \frac{1360k+389}{(-60)^k} W_k\left(\frac{9}{10}\right)$$

divided by $(pn)^2$ is a p-adic integer.

The identity (1.3) is motivated by the following conjecture on related congruences.

Conjecture 3.4. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{50^{n-1}}{4n} \sum_{k=0}^{n-1} (735k+124) 200^{n-1-k} W_k\left(\frac{49}{50}\right) \in \mathbb{Z}^+$$

(ii) Let $p \neq 2, 5$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{735k+124}{200^k} W_k\left(\frac{49}{50}\right) \equiv \frac{p}{32} \left(3969 \left(\frac{-7}{p}\right) - 1\right) \pmod{p^2}.$$

When $\left(\frac{p}{7}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{735k+124}{200^k} W_k\left(\frac{49}{50}\right) - p \sum_{k=0}^{p-1} \frac{735k+124}{200^k} W_k\left(\frac{49}{50}\right)$$

divided by $(pn)^2$ is a p-adic integer.

The identity (1.4) is motivated by the following conjecture on related congruences.

Conjecture 3.5. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{80^{n-1}}{n} \sum_{k=0}^{n-1} (376380k + 69727)(-1)^k 320^{n-1-k} W_k\left(\frac{81}{80}\right) \in \mathbb{Z}^+.$$

(ii) Let $p \neq 2, 5$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{376380k + 69727}{(-320)^k} W_k\left(\frac{81}{80}\right) \equiv \frac{p}{3} \left(209198\left(\frac{-5}{p}\right) - 17\right) \pmod{p^2}.$$

When $\left(\frac{-5}{p}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{376380k + 69727}{(-320)^k} W_k\left(\frac{81}{80}\right) - p \sum_{k=0}^{p-1} \frac{376380k + 69727}{(-320)^k} W_k\left(\frac{81}{80}\right)$$

divided by $(pn)^2$ is a p-adic integer.

The identity (1.5) is motivated by the following conjecture on related congruences.

Conjecture 3.6. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{325^{n-1}}{n} \sum_{k=0}^{n-1} (348840k + 47461) 1300^{n-1-k} W_k\left(\frac{324}{325}\right) \in \mathbb{Z}^+,$$

and this number is odd if and only if $n \in \{2^a : a \in \mathbb{N}\}$.

(ii) Let $p \neq 2, 5, 13$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{348840k + 47461}{1300^k} W_k\left(\frac{324}{325}\right) \equiv \frac{p}{3} \left(142384\left(\frac{-2}{p}\right) - 1\right) \pmod{p^2}.$$

When $p \equiv 1,3 \pmod{8}$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{348840k + 47461}{1300^k} W_k\left(\frac{324}{325}\right) - p \sum_{k=0}^{p-1} \frac{348840k + 47461}{1300^k} W_k\left(\frac{324}{325}\right)$$

divided by $(pn)^2$ is a p-adic integer.

The identity (1.6) is motivated by the following conjecture on related congruences.

Conjecture 3.7. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{1445^{n-1}}{n} \sum_{k=0}^{n-1} (41673840k + 4777111)5780^{n-1-k} W_k\left(\frac{1444}{1445}\right) \in \mathbb{Z}^+,$$

and this number is odd if and only if $n \in \{2^a : a \in \mathbb{N}\}$. (ii) Let $p \neq 2, 5, 17$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{41673840k + 4777111}{5780^k} W_k\left(\frac{1444}{1445}\right) \equiv p\left(4777113\left(\frac{-95}{p}\right) - 2\right) \pmod{p^2}.$$

When $\left(\frac{-95}{p}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{5928k+253}{5780^k} W_k\left(\frac{1156}{5}\right) - p \sum_{k=0}^{p-1} \frac{5928k+253}{5780^k} W_k\left(\frac{1156}{5}\right)$$

divided by $(pn)^2$ is a p-adic integer.

The identity (1.7) is motivated by our following conjecture on related congruences (see also [16, A337332]).

Conjecture 3.8. (i) For any integer n > 1, we have

$$\frac{8^{n-1}}{6n} \sum_{k=0}^{n-1} (4k+1)6^{n-1-k} W_k\left(-\frac{1}{8}\right) \in \mathbb{Z}^+.$$

(ii) For any prime p > 5, we have

$$\frac{1}{p}\sum_{k=0}^{p-1}\frac{4k+1}{6^k}W_k\left(-\frac{1}{8}\right) \equiv \begin{cases} (-3)^{(p-1)/4} \pmod{p} & \text{if } p \equiv 1 \pmod{12}, \\ -5(-3)^{(p-1)/4} \pmod{p} & \text{if } p \equiv 5 \pmod{12}, \\ -(-3)^{(p+5)/4} \pmod{p} & \text{if } p \equiv 7 \pmod{12}, \\ -(-3)^{(p+1)/4} \pmod{p} & \text{if } p \equiv 11 \pmod{12}. \end{cases}$$

(iii) For any prime p > 3, we have

$$\sum_{k=0}^{p-1} \frac{1}{6^k} W_k \left(-\frac{1}{8}\right)$$

$$\equiv \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } p \equiv 1 \pmod{4} \& p = x^2 + 4y^2 \ (x, y \in \mathbb{Z}), \\ 0 \pmod{p^2} & \text{if } p \equiv 3 \pmod{4}. \end{cases}$$

Remark 3.1. Sun [18, Identity (I5)] asserts that

$$\sum_{k=0}^{\infty} \frac{6k+1}{256^k} \binom{2k}{k}^2 T_k(8,-2) = \frac{2}{\pi} \sqrt{8+6\sqrt{2}},$$

which is similar to (3.1). Similar to Conjecture 3.8, we conjecture that for any integer n > 1 we have

$$\frac{1}{4n\binom{2n}{n}}\sum_{k=0}^{n-1}(6k+1)256^{n-1-k}\binom{2k}{k}^2T_k(8,-2)\in\mathbb{Z}^+,$$

and that for any odd prime p we have

$$\sum_{k=0}^{p-1} \frac{6k+1}{256^k} \binom{2k}{k}^2 T_k(8,-2) \equiv \begin{cases} 2^{(p-1)/4} p \pmod{p^2} & \text{if } p \equiv 1 \pmod{4}, \\ -2^{(p+1)/4} p \pmod{p^2} & \text{if } p \equiv 3 \pmod{4}. \end{cases}$$

The identity (1.8) is motivated by the following conjecture on related congruences.

Conjecture 3.9. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{12^{n-1}}{n} \sum_{k=0}^{n-1} (392k+65)(-1)^k 108^{n-1-k} W_k\left(-\frac{49}{12}\right) \in \mathbb{Z}^+.$$

(ii) Let p > 3 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{392k+65}{(-108)^k} W_k\left(-\frac{49}{12}\right) \equiv p\left(86\left(\frac{-3}{p}\right) - 21\left(\frac{21}{p}\right)\right) \pmod{p^2}.$$

When $\left(\frac{p}{7}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{392k+65}{(-108)^k} W_k\left(-\frac{49}{12}\right) - p\left(\frac{p}{3}\right) \sum_{k=0}^{p-1} \frac{392k+65}{(-108)^k} W_k\left(-\frac{49}{12}\right)$$

divided by $(pn)^2$ is a p-adic integer.

(iii) For any prime p > 5, we have

$$\sum_{k=0}^{p-1} \frac{1}{(-108)^k} W_k\left(-\frac{49}{12}\right)$$

$$\equiv \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{-2}{p}\right) = \left(\frac{p}{3}\right) = \left(\frac{p}{7}\right) = 1 \& p = x^2 + 42y^2, \\ 2p - 8x^2 \pmod{p^2} & \text{if } \left(\frac{p}{7}\right) = 1, \ \left(\frac{-2}{p}\right) = \left(\frac{p}{3}\right) = -1 \& p = 2x^2 + 21y^2, \\ 12x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{-2}{p}\right) = 1, \ \left(\frac{p}{3}\right) = \left(\frac{p}{7}\right) = -1 \& p = 3x^2 + 14y^2, \\ 2p - 24x^2 \pmod{p^2} & \text{if } \left(\frac{p}{3}\right) = 1, \ \left(\frac{-2}{p}\right) = \left(\frac{p}{7}\right) = -1 \& p = 6x^2 + 7y^2, \\ 0 \pmod{p^2} & \text{if } \left(\frac{-42}{p}\right) = -1, \end{cases}$$

where x and y are integers.

Remark 3.2. Note that the imaginary quadratic field $\mathbb{Q}(\sqrt{-42})$ has class number four. For primes in the form $x^2 + dy^2$ with $x, y \in \mathbb{Z}$, one my consult the book [7].

The identity (1.9) is motivated by the following conjecture on related congruences.

Conjecture 3.10. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{16^{n-1}}{n} \sum_{k=0}^{n-1} (168k+23) 112^{n-1-k} W_k\left(\frac{63}{16}\right) \in \mathbb{Z}^+.$$

(ii) Let $p \neq 2, 7$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{168k+23}{112^k} W_k\left(\frac{63}{16}\right) \equiv \frac{p}{2} \left(59\left(\frac{-3}{p}\right) - 13\left(\frac{21}{p}\right)\right) \pmod{p^2}.$$

When $\left(\frac{p}{7}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{168k+23}{112^k} W_k\left(\frac{63}{16}\right) - p\left(\frac{p}{3}\right) \sum_{k=0}^{p-1} \frac{168k+23}{112^k} W_k\left(\frac{63}{16}\right)$$

divided by $(pn)^2$ is a p-adic integer.

(iii) For any prime p > 3 with $p \neq 7$, we have

$$\sum_{k=0}^{p-1} \frac{1}{112^k} W_k \begin{pmatrix} 63\\ 16 \end{pmatrix}$$

$$= \begin{cases} 4x^2 - 2p \pmod{p^2} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{3}\right) = \left(\frac{p}{7}\right) = 1 \& p = x^2 + 42y^2, \\ 2p - 8x^2 \pmod{p^2} & if \left(\frac{p}{7}\right) = 1, \ \left(\frac{-2}{p}\right) = \left(\frac{p}{3}\right) = -1 \& p = 2x^2 + 21y^2, \\ 12x^2 - 2p \pmod{p^2} & if \left(\frac{-2}{p}\right) = 1, \ \left(\frac{p}{3}\right) = \left(\frac{p}{7}\right) = -1 \& p = 3x^2 + 14y^2, \\ 2p - 24x^2 \pmod{p^2} & if \left(\frac{p}{3}\right) = 1, \ \left(\frac{-2}{p}\right) = \left(\frac{p}{7}\right) = -1 \& p = 6x^2 + 7y^2, \\ 0 \pmod{p^2} & if \left(\frac{-42}{p}\right) = -1, \end{cases}$$

where x and y are integers.

The identity (1.10) is motivated by the following conjecture on related congruences.

Conjecture 3.11. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{64^{n-1}}{n}\sum_{k=0}^{n-1} (1512k+257)(-1)^k 320^{n-1-k} W_k\left(-\frac{405}{64}\right) \in \mathbb{Z}^+.$$

(ii) Let $p \neq 2, 5$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{1512k + 257}{(-320)^k} W_k\left(-\frac{405}{64}\right) \equiv \frac{p}{10} \left(2849 \left(\frac{-35}{p}\right) - 279 \left(\frac{5}{p}\right)\right) \pmod{p^2}.$$

When $\left(\frac{p}{7}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{1512k+257}{(-320)^k} W_k\left(-\frac{405}{64}\right) - p\left(\frac{p}{5}\right) \sum_{k=0}^{p-1} \frac{1512k+257}{(-320)^k} W_k\left(-\frac{405}{64}\right)$$

divided by $(pn)^2$ is a p-adic integer.

(iii) For any prime p > 5, we have

$$\sum_{k=0}^{p-1} \frac{1}{(-320)^k} W_k \left(-\frac{405}{64}\right)$$

$$= \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{2}{p}\right) = \left(\frac{p}{5}\right) = \left(\frac{p}{7}\right) = 1 \& p = x^2 + 70y^2, \\ 2p - 8x^2 \pmod{p^2} & \text{if } \left(\frac{p}{7}\right) = 1, \ \left(\frac{2}{p}\right) = \left(\frac{p}{5}\right) = -1 \& p = 2x^2 + 35y^2, \\ 20x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{p}{5}\right) = 1, \ \left(\frac{2}{p}\right) = \left(\frac{p}{7}\right) = -1 \& p = 5x^2 + 14y^2, \\ 28x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{2}{p}\right) = 1, \ \left(\frac{p}{5}\right) = \left(\frac{p}{7}\right) = -1 \& p = 7x^2 + 10y^2, \\ 0 \pmod{p^2} & \text{if } \left(\frac{-70}{p}\right) = -1, \end{cases}$$

where x and y are integers.

Remark 3.3. Note that the imaginary quadratic field $\mathbb{Q}(\sqrt{-70})$ has class number four.

The identity (1.11) is motivated by the following conjecture on related congruences.

Conjecture 3.12. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{4^{n-1}}{n} \sum_{k=0}^{n-1} (56k+9)324^{n-1-k} W_k\left(\frac{25}{4}\right) \in \mathbb{Z}^+.$$

(ii) Let p > 3 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{56k+9}{324^k} W_k\left(\frac{25}{4}\right) \equiv \frac{p}{5} \left(49\left(\frac{-35}{p}\right) - 4\left(\frac{5}{p}\right)\right) \pmod{p^2}.$$

When $\left(\frac{p}{7}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{56k+9}{324^k} W_k\left(\frac{25}{4}\right) - p\left(\frac{p}{5}\right) \sum_{k=0}^{p-1} \frac{56k+9}{324^k} W_k\left(\frac{25}{4}\right)$$

divided by $(pn)^2$ is a p-adic integer.

(iii) For any prime p > 5, we have

$$\begin{split} &\sum_{k=0}^{p-1} \frac{1}{324^k} W_k \left(\frac{25}{4}\right) \\ &= \begin{cases} 4x^2 - 2p \pmod{p^2} & if\left(\frac{2}{p}\right) = \left(\frac{p}{5}\right) = \left(\frac{p}{7}\right) = 1 \ \& \ p = x^2 + 70y^2, \\ 2p - 8x^2 \pmod{p^2} & if\left(\frac{p}{7}\right) = 1, \ \left(\frac{2}{p}\right) = \left(\frac{p}{5}\right) = -1 \ \& \ p = 2x^2 + 35y^2, \\ 20x^2 - 2p \pmod{p^2} & if\left(\frac{p}{5}\right) = 1, \ \left(\frac{2}{p}\right) = \left(\frac{p}{7}\right) = -1 \ \& \ p = 5x^2 + 14y^2, \\ 28x^2 - 2p \pmod{p^2} & if\left(\frac{2}{p}\right) = 1, \ \left(\frac{p}{5}\right) = \left(\frac{p}{7}\right) = -1 \ \& \ p = 7x^2 + 10y^2, \\ 0 \pmod{p^2} & if\left(\frac{-70}{p}\right) = -1, \end{cases}$$

where x and y are integers.

The identity (1.12) is motivated by the following conjecture on related congruences.

Conjecture 3.13. (i) For any n > 1 we have

$$\frac{9^{n-1}}{n} \sum_{k=0}^{n-1} (13000k - 1811)(-1)^k 1296^{n-1-k} W_k\left(-\frac{625}{9}\right) \in \mathbb{Z}^+,$$

and this number is odd if and only if n is a power of two.

(ii) Let p > 3 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{13000k - 1811}{(-1296)^k} W_k\left(-\frac{625}{9}\right) \equiv \frac{p}{5} \left(11882 \left(\frac{-39}{p}\right) - 20937\right) \pmod{p^2}.$$

When $\left(\frac{-39}{p}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{13000k - 1811}{(-1296)^k} W_k\left(-\frac{625}{9}\right) - p \sum_{k=0}^{p-1} \frac{13000k - 1811}{(-1296)^k} W_k\left(-\frac{625}{9}\right)$$

divided by $(pn)^2$ is a p-adic integer.

(iii) For any prime p > 5, we have

$$\sum_{k=0}^{p-1} \frac{1}{(-1296)^k} W_k \left(-\frac{625}{9}\right)$$

$$= \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{2}{p}\right) = \left(\frac{p}{3}\right) = \left(\frac{p}{13}\right) = 1 \& p = x^2 + 78y^2, \\ 8x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{2}{p}\right) = 1, \ \left(\frac{p}{3}\right) = \left(\frac{p}{13}\right) = -1 \& p = 2x^2 + 39y^2, \\ 12x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{p}{13}\right) = 1, \ \left(\frac{2}{p}\right) = \left(\frac{p}{3}\right) = -1 \& p = 3x^2 + 26y^2, \\ 24x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{p}{3}\right) = 1, \ \left(\frac{2}{p}\right) = \left(\frac{p}{13}\right) = -1 \& p = 6x^2 + 13y^2, \\ 0 \pmod{p^2} & \text{if } \left(\frac{-78}{p}\right) = -1, \end{cases}$$

where x and y are integers.

-1

Remark 3.4. Note that the imaginary quadratic field $\mathbb{Q}(\sqrt{-78})$ has class number four.

The identity (1.13) is motivated by the following conjecture on related congruences.

Conjecture 3.14. (i) For any n > 1 we have

$$\frac{13^{n-1}}{n} \sum_{k=0}^{n-1} (9360k - 1343) 1300^{n-1-k} W_k\left(\frac{900}{13}\right) \in \mathbb{Z}^+,$$

and this number is odd if and only if n is a power of two.

(ii) Let $p \neq 2, 5, 13$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{9360k - 1343}{1300^k} W_k\left(\frac{900}{13}\right) \equiv \frac{p}{5} \left(7944 \left(\frac{-39}{p}\right) - 14659\right) \pmod{p^2}.$$

When $\left(\frac{-39}{p}\right) = 1$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{9360k - 1343}{1300^k} W_k\left(\frac{900}{13}\right) - p \sum_{k=0}^{p-1} \frac{9360k - 1343}{1300^k} W_k\left(\frac{900}{13}\right)$$

divided by $(pn)^2$ is a p-adic integer.

(iii) For any prime p > 5, we have

$$\sum_{k=0}^{p-1} \frac{1}{1300^k} W_k \left(\frac{900}{13}\right)$$

$$= \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{2}{p}\right) = \left(\frac{p}{3}\right) = \left(\frac{p}{13}\right) = 1 \& p = x^2 + 78y^2, \\ 8x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{2}{p}\right) = 1, \ \left(\frac{p}{3}\right) = \left(\frac{p}{13}\right) = -1 \& p = 2x^2 + 39y^2, \\ 12x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{p}{13}\right) = 1, \ \left(\frac{2}{p}\right) = \left(\frac{p}{3}\right) = -1 \& p = 3x^2 + 26y^2, \\ 24x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{p}{3}\right) = 1, \ \left(\frac{2}{p}\right) = \left(\frac{p}{13}\right) = -1 \& p = 6x^2 + 13y^2, \\ 0 \pmod{p^2} & \text{if } \left(\frac{-78}{p}\right) = -1, \end{cases}$$

where x and y are integers.

The identity (1.14) is motivated by the following conjecture on related congruences.

Conjecture 3.15. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{361^{n-1}}{n}\sum_{k=0}^{n-1} (56355k+2443)(-1)^k 5776^{n-1-k}W_k\left(-\frac{83521}{361}\right) \in \mathbb{Z}^+.$$

(ii) Let $p \neq 2, 19$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{56355k + 2443}{(-5776)^k} W_k\left(-\frac{83521}{361}\right) \equiv \frac{7p}{323} \left(426855 \left(\frac{-2}{p}\right) - 314128\right) \pmod{p^2}.$$

When $p \equiv 1, 3 \pmod{8}$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{56355k + 2443}{(-5776)^k} W_k\left(-\frac{83521}{361}\right) - p \sum_{k=0}^{p-1} \frac{56355k + 2443}{(-5776)^k} W_k\left(-\frac{83521}{361}\right)$$

divided by $(pn)^2$ is a p-adic integer.

(iii) For any prime $p \neq 2, 19$, we have

$$\sum_{k=0}^{p-1} \frac{1}{(-5776)^k} W_k \left(-\frac{83521}{361} \right)$$

$$= \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{-2}{p} \right) = \left(\frac{p}{5} \right) = \left(\frac{p}{13} \right) = 1 \& p = x^2 + 130y^2, \\ 8x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{-2}{p} \right) = 1, \ \left(\frac{p}{5} \right) = \left(\frac{p}{13} \right) = -1 \& p = 2x^2 + 65y^2, \\ 20x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{p}{5} \right) = 1, \ \left(\frac{-2}{p} \right) = \left(\frac{p}{13} \right) = -1 \& p = 5x^2 + 26y^2, \\ 40x^2 - 2p \pmod{p^2} & \text{if } \left(\frac{p}{13} \right) = 1, \ \left(\frac{-2}{p} \right) = \left(\frac{p}{5} \right) = -1 \& p = 10x^2 + 13y^2, \\ p\delta_{p,17} \pmod{p^2} & \text{if } \left(\frac{-130}{p} \right) = -1, \end{cases}$$

where x and y are integers.

Remark 3.5. Note that the imaginary quadratic field $\mathbb{Q}(\sqrt{-130})$ has class number four.

The identity (1.15) is motivated by the following conjecture on related congruences.

Conjecture 3.16. (i) For any $n \in \mathbb{Z}^+$ we have

$$\frac{5^{n-1}}{n} \sum_{k=0}^{n-1} (5928k + 253) 5780^{n-1-k} W_k\left(\frac{1156}{5}\right) \in \mathbb{Z}^+,$$

and this number is odd if and only if $n \in \{2^a : a \in \mathbb{N}\}$. (ii) Let $p \neq 2, 5, 17$ be a prime. Then

$$\sum_{k=0}^{p-1} \frac{5928k + 253}{5780^k} W_k\left(\frac{1156}{5}\right) \equiv \frac{p}{85} \left(81744 \left(\frac{-2}{p}\right) - 60239\right) \pmod{p^2}.$$

When $p \equiv 1, 3 \pmod{8}$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{5928k+253}{5780^k} W_k\left(\frac{1156}{5}\right) - p \sum_{k=0}^{p-1} \frac{5928k+253}{5780^k} W_k\left(\frac{1156}{5}\right)$$

divided by $(pn)^2$ is a p-adic integer.

(iii) For any prime $p \neq 2, 5, 17$, we have

$$\sum_{k=0}^{p-1} \frac{1}{5780^k} W_k \left(\frac{1156}{5}\right)$$

$$= \begin{cases} 4x^2 - 2p \pmod{p^2} & if\left(\frac{-2}{p}\right) = \left(\frac{p}{5}\right) = \left(\frac{p}{13}\right) = 1 \& p = x^2 + 130y^2, \\ 8x^2 - 2p \pmod{p^2} & if\left(\frac{-2}{p}\right) = 1, \left(\frac{p}{5}\right) = \left(\frac{p}{13}\right) = -1 \& p = 2x^2 + 65y^2, \\ 20x^2 - 2p \pmod{p^2} & if\left(\frac{p}{5}\right) = 1, \left(\frac{-2}{p}\right) = \left(\frac{p}{13}\right) = -1 \& p = 5x^2 + 26y^2, \\ 40x^2 - 2p \pmod{p^2} & if\left(\frac{p}{13}\right) = 1, \left(\frac{-2}{p}\right) = \left(\frac{p}{5}\right) = -1 \& p = 10x^2 + 13y^2, \\ 0 \pmod{p^2} & if\left(\frac{-130}{p}\right) = -1, \end{cases}$$

where x and y are integers.

4. A new type series for $1/\pi$ involving generalized central TRINOMIAL COEFFICIENTS

For $b, c \in \mathbb{Z}$ and $n \in \mathbb{N}$ the generalized trinomial coefficient $T_n(b, c)$ denotes the coefficient of x^n in the expansion of $(x^2 + bx + c)^n$.

In 2011, the author [12, 14] posed over 60 conjectural series for $1/\pi$ of the

In 2011, the author [12, 14] posed over 60 conjectural series for $1/\pi$ of the following seven types with a, b, c, d, m integers and $mbcd(b^2 - 4c)$ nonzero. Type I. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} {\binom{2k}{k}}^2 T_k(b,c)$. Type II. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} {\binom{2k}{k}} {\binom{3k}{k}} T_k(b,c)$. Type III. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} {\binom{4k}{2k}} {\binom{2k}{k}} T_k(b,c)$. Type IV. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} {\binom{2k}{k}}^2 T_{2k}(b,c)$. Type V. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} {\binom{2k}{k}}^3 T_{3k}(b,c)$. Type VI. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} T_k(b,c)^3$, Type VII. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} {\binom{2k}{k}} T_k(b,c)^2$,

Though some of these new families of conjectural series for $1/\pi$ have been proved (see, e.g., [3]), the three conjectual series for $1/\pi$ of type VI and two of type VII remain open.

In a recent published paper [18] the author proposed four conjectural series for $1/\pi$ of a new type:

Type VIII. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} T_k(b,c) T_k(b_*,c_*)^2,$

where a, b, b_*, c, c_*, d, m are integers with $mbb_*cc_*d(b^2 - 4c)(b_*^2 - 4c_*)(b^2c_* - 4c_*)(b_*^2 - 4c_*$ $b_*^2 c) \neq 0.$

Here we introduce series for $1/\pi$ involving generalized central trinomial coefficients of the following novel type:

Type IX. $\sum_{k=0}^{\infty} \frac{a+dk}{m^k} {2k \choose k} T_k(b,c) T_k(b_*,c_*),$

where a, b, b_*, c, c_*, d, m are integers with $mbb_*cc_*d(b^2 - 4c)(b_*^2 - 4c_*)(b^2c_* - b_*^2c) \neq 0$.

Conjecture 4.1. We have the following identities:

$$\sum_{k=0}^{\infty} \frac{4290k + 367}{3136^k} \binom{2k}{k} T_k(14, 1) T_k(17, 16) = \frac{5390}{\pi}$$
(IX1)

and

$$\sum_{k=0}^{\infty} \frac{540k+137}{3136^k} \binom{2k}{k} T_k(2,81) T_k(14,81) = \frac{98}{3\pi} (10+7\sqrt{5}).$$
(IX2)

The conjectural identity (IX1) is motivated by the author's following conjecture on congruences.

Conjecture 4.2. (i) For any integer n > 1, we have

$$n\binom{2n}{n} \mid \sum_{k=0}^{n-1} (4290k+367)3136^{n-1-k}\binom{2k}{k}T_k(14,1)T_k(17,16).$$

(ii) Let p be an odd prime with $p \neq 7$. Then

$$\sum_{k=0}^{p-1} \frac{4290k + 367}{3136^k} {\binom{2k}{k}} T_k(14, 1) T_k(17, 16)$$
$$\equiv \frac{p}{2} \left(1430 \left(\frac{-1}{p}\right) + 39 \left(\frac{3}{p}\right) - 735 \right) \pmod{p^2}$$

Moreover, when $p \equiv 1 \pmod{12}$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{4290k+367}{3136^k} \binom{2k}{k} T_k(14,1) T_k(17,16) - p \sum_{k=0}^{n-1} \frac{4290k+367}{3136^k} \binom{2k}{k} T_k(14,1) T_k(17,16)$$

divided by $(pn)^2 \binom{2n}{n}$ is a p-adic integer. (iii) For any prime p > 7, we have

$$\begin{pmatrix} -1\\ p \end{pmatrix} \sum_{k=0}^{p-1} \frac{\binom{2k}{k}}{3136^k} T_k(14,1) T_k(17,16)$$

$$\equiv \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } p \equiv 1,4 \pmod{15} \& p = x^2 + 15y^2 (x, y \in \mathbb{Z}), \\ 2p - 12x^2 \pmod{p^2} & \text{if } p \equiv 2,8 \pmod{15} \& p = 3x^2 + 5y^2 (x, y \in \mathbb{Z}), \\ 0 \pmod{p^2} & \text{if } (\frac{-15}{p}) = -1. \end{cases}$$

Remark 4.1. Note that the imaginary quadratic field $\mathbb{Q}(\sqrt{-15})$ has class number two.

The conjectural identity (IX2) is motivated by the following conjecture on congruences.

Conjecture 4.3. (i) For any integer n > 1, we have

$$2n\binom{2n}{n} \mid \sum_{k=0}^{n-1} (540k+137)3136^{n-1-k}\binom{2k}{k}T_k(2,81)T_k(14,81).$$

(ii) Let p be an odd prime with $p \neq 7$. Then

$$\sum_{k=0}^{p-1} \frac{540k+137}{3136^k} \binom{2k}{k} T_k(2,81) T_k(14,81)$$

$$\equiv \frac{p}{3} \left(270 \left(\frac{-1}{p} \right) - 104 \left(\frac{-2}{p} \right) + 245 \left(\frac{-5}{p} \right) \right) \pmod{p^2}.$$

Moreover, when $p \equiv \pm 1, \pm 9 \pmod{40}$, for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{540k+137}{3136^k} \binom{2k}{k} T_k(2,81) T_k(14,81) - p\left(\frac{-1}{p}\right) \sum_{k=0}^{n-1} \frac{540k+137}{3136^k} \binom{2k}{k} T_k(2,81) T_k(14,81)$$

divided by $(pn)^2 \binom{2n}{n}$ is a p-adic integer. (iii) For any prime p > 7, we have

$$\begin{pmatrix} -1\\ p \end{pmatrix} \sum_{k=0}^{p-1} \frac{\binom{2k}{k}}{3136^k} T_k(2,81) T_k(14,81)$$

$$= \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } (\frac{2}{p}) = (\frac{p}{3}) = (\frac{p}{5}) = 1 \& p = x^2 + 15y^2, \\ 8x^2 - 2p \pmod{p^2} & \text{if } (\frac{2}{p}) = 1, \ (\frac{p}{3}) = (\frac{p}{5}) = -1 \& p = 2x^2 + 15y^2, \\ 20x^2 - 2p \pmod{p^2} & \text{if } (\frac{p}{5}) = 1, \ (\frac{2}{p}) = (\frac{p}{3}) = -1 \& p = 5x^2 + 6y^2, \\ 2p - 12x^2 \pmod{p^2} & \text{if } (\frac{p}{3}) = 1, \ (\frac{2}{p}) = (\frac{p}{5}) = -1 \& p = 3x^2 + 10y^2, \\ 0 \pmod{p^2} & \text{if } (\frac{-30}{p}) = -1, \end{cases}$$

where x and y are integers.

5. Series for $1/\pi$ involving $F_n(x) := \sum_{k=0}^n \binom{n}{k} \binom{n+2k}{2k} \binom{2k}{k} x^{n-k}$

As mentioned in [15, Remark 4.4], an identity of MacMahon implies that the polynomial

$$F_n(x) = \sum_{k=0}^n \binom{n}{k} \binom{n+2k}{2k} \binom{2k}{k} x^{n-k}$$

at x = -4 coincides with the Franel number $f_n = \sum_{k=0}^n {\binom{n}{k}}^3$. Conjecture 4.4 of Sun [15] lists ten conjectural series for $1/\pi$ involving $F_n(x)$ with $x \neq -4$;

eight of them were later confirmed in [6], but the following two remain open:

$$\sum_{k=0}^{\infty} \frac{357k + 103}{2160^k} \binom{2k}{k} F_k(-324) = \frac{90}{\pi},$$
(5.1)

$$\sum_{k=0}^{\infty} \frac{k}{3645^k} \binom{2k}{k} F_k(486) = \frac{10}{3\pi}.$$
(5.2)

Here we pose the following new conjecture.

Conjecture 5.1. We have the following identities:

$$\sum_{k=0}^{\infty} \frac{6k+1}{(-1728)^k} \binom{2k}{k} F_k(-324) = \frac{24}{25\pi} \sqrt{375+120\sqrt{10}},\tag{5.3}$$

$$\sum_{k=0}^{\infty} \frac{4k+1}{(-160)^k} \binom{2k}{k} F_k(-20) = \frac{\sqrt{30}}{5\pi} \cdot \frac{5+\sqrt[3]{145+30\sqrt{6}}}{\sqrt[6]{145+30\sqrt{6}}},\tag{5.4}$$

$$\sum_{k=0}^{\infty} \frac{1290k + 289}{27648^k} \binom{2k}{k} F_k(-2160) = \frac{96\sqrt{15}}{\pi},\tag{5.5}$$

$$\sum_{k=0}^{\infty} \frac{804k+49}{276480^k} \binom{2k}{k} F_k(12096) = \frac{120\sqrt{15}}{\pi},$$
(5.6)

$$\sum_{k=0}^{\infty} (24k+5) \left(\frac{2}{135}\right)^k F_k\left(-\frac{27}{8}\right) = \frac{3}{2\pi} (5\sqrt{6} + 4\sqrt{15}).$$
(5.7)

Remark 5.1. The author found (5.3)-(5.7) during August 19-27, 2020. As all of them converge quickly, one can easily check them via Mathematica or Maple.

The identity (5.3) is motivated by [15, Conjecture 4.6] and the following conjecture.

Conjecture 5.2. Let n > 1 be an integer. Then

$$\frac{1}{n\binom{2n}{n}}\sum_{k=0}^{n-1}(-1)^k(6k+1)1728^{n-1-k}\binom{2k}{k}F_k(-324)\in\mathbb{Z}^+,$$

and this number is odd if and only if $n \in \{2^a + 1 : a \in \mathbb{N}\}$.

Remark 5.2. The reader might wonder how we found the right-hand side of the identity (5.3). We thought that the left-hand side of (5.3) times π is an algebraic number and found the form of this algebraic number via calculating its first 100 digits and using the Maple command identify.

The identity (5.4) is motivated by the following conjecture on related congruences.

Conjecture 5.3. (i) Let n > 1 be an integer. Then

$$\frac{1}{n\binom{2n}{n}}\sum_{k=0}^{n-1}(-1)^k(4k+1)160^{n-1-k}\binom{2k}{k}F_k(-20)\in\mathbb{Z}^+,$$

and this number is odd if and only if $n \in \{2^a + 1 : a \in \mathbb{N}\}$.

(ii) For any odd prime p, we have

$$\begin{pmatrix} \frac{p}{5} \end{pmatrix} \sum_{k=0}^{p-1} \frac{\binom{2k}{k}}{(-160)^k} F_k(-20) \equiv \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } p \equiv 1,3 \pmod{8} \& p = x^2 + 2y^2 (x, y \in \mathbb{Z}), \\ 0 \pmod{p^2} & \text{if } p \equiv 5,7 \pmod{8}. \end{cases}$$

Remark 5.3. See [16, A337247] for a sequence related to the first part. Part (i) of this conjecture implies that for any odd prime $p \neq 5$ we have

$$\sum_{k=0}^{p-1} \frac{4k+1}{(-160)^k} \binom{2k}{k} F_k(-20) \equiv 0 \pmod{p},$$

which was observed by the author on Jan. 18, 2012.

The identity (5.5) is motivated by the following conjecture on congruences.

Conjecture 5.4. (i) Let n > 1 be an integer. Then

$$\frac{1}{n\binom{2n}{n}}\sum_{k=0}^{n-1} (1290k+289)27648^{n-1-k}\binom{2k}{k}F_k(-2160) \in \mathbb{Z}^+,$$

and this number is odd if and only if $n \in \{2^a + 1 : a \in \mathbb{N}\}$. (ii) Let p > 3 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{1290k + 289}{27648^k} \binom{2k}{k} F_k(-2160) \equiv p\left(104\left(\frac{3}{p}\right) + 185\left(\frac{-15}{p}\right)\right) \pmod{p^2}.$$

Moreover, if $\left(\frac{-5}{p}\right) = 1$ then for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{1290k+289}{27648^k} \binom{2k}{k} F_k(-2160) - p\left(\frac{3}{p}\right) \sum_{k=0}^{n-1} \frac{1290k+289}{27648^k} \binom{2k}{k} F_k(-2160)$$

divided by $(pn)^2 \binom{2n}{n}$ is a p-adic integer.

(iii) Let p > 3 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{\binom{2k}{k}}{27648^k} F_k(-2160) \\ = \begin{cases} 4x^2 - 2p \pmod{p^2} & if\left(\frac{-1}{p}\right) = \binom{p}{3} = \binom{p}{5} = \binom{p}{11} = 1, \ p = x^2 + 165y^2, \\ 2x^2 - 2p \pmod{p^2} & if\left(\frac{-1}{p}\right) = \binom{p}{3} = \binom{p}{5} = \binom{p}{11} = -1, \ 2p = x^2 + 165y^2, \\ 2p - 12x^2 \pmod{p^2} & if\left(\frac{-1}{p}\right) = \binom{p}{5} = -1, \ \binom{p}{3} = \binom{p}{11} = 1, \ p = 3x^2 + 55y^2, \\ 2p - 6x^2 \pmod{p^2} & if\left(\frac{-1}{p}\right) = \binom{p}{5} = 1, \ \binom{p}{3} = \binom{p}{11} = -1, \ 2p = 3x^2 + 55y^2, \\ 20x^2 - 2p \pmod{p^2} & if\left(\frac{-1}{p}\right) = \binom{p}{11} = 1, \ \binom{p}{3} = \binom{p}{5} = -1, \ p = 5x^2 + 33y^2, \\ 10x^2 - 2p \pmod{p^2} & if\left(\frac{-1}{p}\right) = \binom{p}{11} = -1, \ \binom{p}{3} = \binom{p}{5} = 1, \ 2p = 5x^2 + 33y^2, \\ 44x^2 - 2p \pmod{p^2} & if\left(\frac{-1}{p}\right) = \binom{p}{3} = -1, \ \binom{p}{5} = \binom{p}{11} = 1, \ p = 11x^2 + 15y^2, \\ 22x^2 - 2p \pmod{p^2} & if\left(\frac{-1}{p}\right) = \binom{p}{3} = 1, \ \binom{p}{5} = \binom{p}{11} = -1, \ 2p = 11x^2 + 15y^2, \\ 0 \pmod{p^2} & if\left(\frac{-165}{p}\right) = -1, \end{cases}$$

where x and y are integers.

Remark 5.4. Note that the imaginary quadratic field $\mathbb{Q}(\sqrt{-165})$ has class number eight.

The identity (5.6) is motivated by the following conjecture on related congruences.

Conjecture 5.5. (i) Let n > 1 be an integer. Then

$$\frac{1}{n\binom{2n}{n}}\sum_{k=0}^{n-1} (804k+49)276480^{n-1-k}\binom{2k}{k}F_k(12096) \in \mathbb{Z}^+,$$

and this number is odd if and only if $n \in \{2^a + 1 : a \in \mathbb{N}\}$.

(ii) Let p > 5 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{804k+49}{276480^k} \binom{2k}{k} F_k(12096) \equiv p\left(95\left(\frac{-15}{p}\right) - 46\left(\frac{30}{p}\right)\right) \pmod{p^2}.$$

Moreover, if $p \equiv 1, 3 \pmod{8}$ then for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{804k+49}{276480^k} \binom{2k}{k} F_k(12096) - p\left(\frac{-15}{p}\right) \sum_{k=0}^{n-1} \frac{804k+49}{276480^k} \binom{2k}{k} F_k(12096)$$

divided by $(pn)^2 \binom{2n}{n}$ is a p-adic integer.

(iii) Let p > 5 be a prime. Then

$$= \begin{cases} \frac{p-1}{276480^k} F_k(12096) \\ \frac{4x^2 - 2p \pmod{p^2}}{8x^2 - 2p \pmod{p^2}} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{3}\right) = \left(\frac{p}{5}\right) = \left(\frac{p}{7}\right) = 1 \ \& \ p = x^2 + 210y^2, \\ 8x^2 - 2p \pmod{p^2} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{7}\right) = 1, \ \left(\frac{p}{3}\right) = \left(\frac{p}{5}\right) = -1 \ \& \ p = 2x^2 + 105y^2, \\ 2p - 12x^2 \pmod{p^2} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{3}\right) = 1, \ \left(\frac{p}{5}\right) = \left(\frac{p}{7}\right) = -1 \ \& \ p = 3x^2 + 70y^2, \\ 20x^2 - 2p \pmod{p^2} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{3}\right) = \left(\frac{p}{5}\right) = \left(\frac{p}{7}\right) = -1 \ \& \ p = 5x^2 + 42y^2, \\ 2p - 24x^2 \pmod{p^2} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{5}\right) = 1, \ \left(\frac{p}{3}\right) = \left(\frac{p}{7}\right) = -1 \ \& \ p = 6x^2 + 35y^2, \\ 28x^2 - 2p \pmod{p^2} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{5}\right) = -1, \ \left(\frac{p}{3}\right) = \left(\frac{p}{7}\right) = 1 \ \& \ p = 7x^2 + 30y^2, \\ 40x^2 - 2p \pmod{p^2} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{7}\right) = -1, \ \left(\frac{p}{3}\right) = \left(\frac{p}{5}\right) = 1 \ \& \ p = 10x^2 + 21y^2, \\ 56x^2 - 2p \pmod{p^2} & if \left(\frac{-2}{p}\right) = \left(\frac{p}{3}\right) = -1, \ \left(\frac{p}{5}\right) = \left(\frac{p}{7}\right) = 1 \ \& \ p = 14x^2 + 15y^2, \\ 0 \pmod{p^2} & if \left(\frac{-210}{p}\right) = -1, \end{cases}$$

where x and y are integers.

Remark 5.5. Note that the imaginary quadratic field $\mathbb{Q}(\sqrt{-210})$ has class number eight.

The identity (5.7) is motivated by the following conjecture on related congruences.

Conjecture 5.6. (i) Let n be any positive integer. Then

$$\frac{4^{n-1}}{n\binom{2n-1}{n-1}}\sum_{k=0}^{n-1}(24k+5)135^{n-1-k}2^k\binom{2k}{k}F_k\left(-\frac{27}{8}\right)\in\mathbb{Z}^+,$$

and this number is congruent to 5 modulo 8.

(ii) Let p > 5 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{(24k+5)2^k}{135^k} \binom{2k}{k} F_k\left(-\frac{27}{8}\right) \equiv p\left(95\left(4\frac{-6}{p}\right) + \left(\frac{-15}{p}\right)\right) \pmod{p^2}.$$

Moreover, if $(\frac{10}{p}) = 1$ then for any $n \in \mathbb{Z}^+$ the number

$$\sum_{k=0}^{pn-1} \frac{(24k+5)2^k}{135^k} \binom{2k}{k} F_k\left(-\frac{27}{8}\right) - p\left(\frac{-6}{p}\right) \sum_{k=0}^{n-1} \frac{(24k+5)2^k}{135^k} \binom{2k}{k} F_k\left(-\frac{27}{8}\right)$$

divided by $(pn)^2 \binom{2n}{n}$ is a p-adic integer.

(iii) Let
$$p > 5$$
 be a prime. Then

$$\sum_{k=0}^{p-1} \frac{2^k \binom{2k}{k}}{135^k} F_k\left(-\frac{27}{8}\right)$$

$$= \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } (\frac{2}{p}) = (\frac{p}{3}) = (\frac{p}{5}) = 1 \& p = x^2 + 30y^2, \\ 8x^2 - 2p \pmod{p^2} & \text{if } (\frac{2}{p}) = 1, \ (\frac{p}{3}) = (\frac{p}{5}) = -1 \& p = 2x^2 + 15y^2, \\ 2p - 12x^2 \pmod{p^2} & \text{if } (\frac{p}{3}) = 1, \ (\frac{2}{p}) = (\frac{p}{5}) = -1 \& p = 3x^2 + 10y^2, \\ 20x^2 - 2p \pmod{p^2} & \text{if } (\frac{p}{5}) = 1, \ (\frac{2}{p}) = (\frac{p}{3}) = -1 \& p = 5x^2 + 6y^2, \\ 0 \pmod{p^2} & \text{if } (\frac{-30}{p}) = -1, \end{cases}$$

where x and y are integers.

Remark 5.6. Note that the imaginary quadratic field $\mathbb{Q}(\sqrt{-30})$ has class number four.

6. One more conjectural series for $1/\pi$ and related congruences

In Jan. 2012 the author (cf. [14, (8)]) conjectured that

$$\sum_{n=0}^{\infty} \frac{28n+5}{576^n} \binom{2n}{n} \sum_{k=0}^n \frac{5^k \binom{2k}{k}^2 \binom{2(n-k)}{n-k}^2}{\binom{n}{k}} = \frac{9}{\pi} (2+\sqrt{2}), \quad (6.1)$$

which remains open up to now. Here we pose a similar conjecture.

Conjecture 6.1. We have the following identity:

$$\sum_{n=0}^{\infty} \frac{182n+31}{576^n} \binom{2n}{n} \sum_{k=0}^n \frac{\binom{2k}{k}^2 \binom{2(n-k)}{n-k}^2}{\binom{n}{k}} \left(-\frac{25}{16}\right)^k = \frac{189}{2\pi}.$$
 (6.2)

This is motivated by the author's following conjecture on related congruences.

Conjecture 6.2. Let p > 3 be a prime. Then

$$\sum_{n=0}^{p-1} \frac{182n+31}{576^n} {\binom{2n}{n}} \sum_{k=0}^n \frac{{\binom{2k}{k}}^2 {\binom{2n-2k}{n-k}}^2}{{\binom{n}{k}}} \left(-\frac{25}{16}\right)^k$$
$$\equiv \frac{p}{2} \left(63 \left(\frac{-1}{p}\right) - 1\right) \pmod{p^2}.$$

Also,

$$\sum_{n=0}^{p-1} \frac{\binom{2n}{n}}{576^n} \sum_{k=0}^n \frac{\binom{2k}{k}^2 \binom{2n-2k}{n-k}^2}{\binom{n}{k}} \left(-\frac{25}{16}\right)^k \\ \equiv \begin{cases} 4x^2 - 2p \pmod{p^2} & \text{if } \binom{p}{7} = 1 \& \ p = x^2 + 7y^2 \ (x, y \in \mathbb{Z}), \\ 0 \pmod{p^2} & \text{if } \binom{p}{7} = -1, \ i.e., \ p \equiv 3, 5, 6 \pmod{7}. \end{cases}$$

Acknowledgment

The author would like to thank his PhD student Chen Wang for helpful comments.
