# Modular Dilogarithms 

## with Bill Gosper \& Cheryl Beaver and kibbitzing from <br> Don Zagier \& Herbert Gangl

Paper at www.cs.arizona.edu/~rcs
$\mathrm{Li}_{2}$

## Classical Dilogarithm

$$
\begin{aligned}
& \mathrm{Li}_{2}(\mathrm{z})=\mathrm{z}+\frac{\mathrm{z}^{2}}{4}+\frac{\mathrm{z}^{3}}{9}+\frac{\mathrm{z}^{4}}{16}+\ldots
\end{aligned}
$$

Power series converges when $|z|<=1$ Analytic extension for larger z .

## Functional Equations

$$
\begin{aligned}
& \mathrm{Li}_{2}(\mathrm{z})+\mathrm{Li}_{2}(1-\mathrm{z})=\mathrm{pi}^{2} / 6-\ln \mathrm{z} \ln (1-\mathrm{z}) \\
& \mathrm{Li}_{2}(\mathrm{z})+\mathrm{Li}_{2}(1 / \mathrm{z})=-\mathrm{pi}^{2} / 6-1 / 2 \ln (-\mathrm{z})^{2} \\
& \mathrm{Li}_{2}(\mathrm{z})+\mathrm{Li}_{2}(-\mathrm{z})=1 / 2 \mathrm{Li}_{2}\left(\mathrm{z}^{2}\right) \\
& \operatorname{Li}_{2}(\mathrm{z})+\mathrm{Li}_{2}(\mathrm{wz})+\mathrm{Li}_{2}\left(\mathrm{w}^{2} \mathrm{z}\right)=\mathrm{Li}_{2}\left(\mathrm{z}^{3}\right) / 3
\end{aligned}
$$

Range reduction $\quad|z|<.8$

## Spence, Hill, ...

$$
\begin{array}{r}
\mathrm{Li}_{2}(\mathrm{xy})=\mathrm{Li}_{2}(\mathrm{x})+\mathrm{Li}_{2}(\mathrm{y})+\mathrm{Li}_{2}\left(\frac{\mathrm{xy}-\mathrm{x}}{1-\mathrm{x}}\right)+\mathrm{Li}_{2}\left(\frac{\mathrm{xy}-\mathrm{y}}{1-\mathrm{y}}\right)+1 / 2 \ln \left(\frac{1-\mathrm{x}}{1-\mathrm{y}}\right)^{2} \\
{[5 \text { term }]}
\end{array}
$$

$$
\begin{array}{r}
2\left[\mathrm{cLi}_{2}(\mathrm{x})+\mathrm{cLi}_{2}(\mathrm{y})+\mathrm{cLi}_{2}(\mathrm{z})\right]= \\
\mathrm{cLi}_{2}(\mathrm{xy})+\mathrm{cLi}_{2}(\mathrm{xz})+\mathrm{cLi}_{2}(\mathrm{yz})
\end{array}
$$

where $\mathrm{cLi}_{2}(\mathrm{x})=\mathrm{Li}_{2}(1-\mathrm{x})$ and $\mathrm{x}+\mathrm{y}+\mathrm{z}=\mathrm{xyz}+2$.

Many more multivariate identities.
Wojtkowiak recently showed 5term implies the others.
$\mathrm{Li}_{2}$

## Modular Dilogarithms:A Shot in the Dark

Is there a modular version of the dilogarithm that satisfies the same algebraic identities?

+ analogy with discrete logarithms
- no rational values except 0

What would this mean? How to find it?
Domain: mod P Range: ???
Riemann sheets? Infinity? -- punt
$\mathrm{Li}_{2}$
Logarithm
$\rightarrow \quad$ Discrete Log

$$
\begin{aligned}
\log _{10} 2=.30103 \ldots & \log _{10} 2= \\
& \bmod 19
\end{aligned} \quad \bmod 189 .
$$

$$
\begin{gathered}
\text { Dilogarithm } \quad \rightarrow \quad \text { Modular Dilog } \\
\mathrm{Li}_{2}(1 / 2)=.58224 \ldots \quad \mathrm{D}(1 / 2)=\mathrm{D}(10)=265 \\
\\
\end{gathered} \quad \begin{aligned}
& \bmod 19 \quad \bmod 360
\end{aligned}
$$

$\mathrm{Li}_{2}$

## Results

Mod 19

| N | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{D}(\mathrm{N})$ | 120 | 30 | 345 | 358 | 74 | 26 | 344 | 258 | 327 | 108 | 265 | 162 | 3 | 132 | 326 | 44 | 236 | 232 | 345 |

Mod 360
Solutions mod P for $\mathrm{P}=5 \ldots 23$.
Answers always mod $\mathrm{P}^{2}-1$.

Nonprime moduli:
Mod 25 -- answers mod $600=24 * 25$.
GF[5²] -- answers mod $624=24 * 26 . \% \%$

## Functional Equations

$$
\begin{aligned}
& D(x)+D(1-x)=D(0)+D(1)+K \log (x) \log (1-x) \\
& 2[D(x)+D(1 / x)]=-2 D(1)+K \log (-x)^{2} \quad x /=0 \\
& 2[D(x)+D(-x)]=D\left(x^{2}\right) \\
& D(x y)=D(x)+D(y)-D((x-x y) /(1-x y))-D((y-x y) /(1-x y)) \\
& \quad+D(0)+K \log ((1-x) /(1-x y)) \log ((1-y) /(1-x y)) \quad x y /=1
\end{aligned}
$$

$2[\mathrm{D}(1-\mathrm{x})+\mathrm{D}(1-\mathrm{y})+\mathrm{D}(1-\mathrm{z})]=\mathrm{D}(1-\mathrm{xy})+\mathrm{D}(1-\mathrm{xz})+\mathrm{D}(1-\mathrm{yz})$ with $\mathrm{z}=(2-\mathrm{x}-\mathrm{y}) /(1-x y)$ and $\mathrm{xy} /=1$.

K is a multiple of $\mathrm{P}+1$. Logs are discrete logs.
Log 0 is always multiplied by $\log 1$.
Full solution Mod 19: $\mathrm{Z}_{360} \times \mathrm{Z}_{3}$.

## Trilogarithms

$$
\operatorname{Li}_{3}(\mathrm{z})=\operatorname{Sum}_{\mathrm{n}=0}^{\infty} \frac{\mathrm{z}^{\mathrm{n}}}{\mathrm{n}^{3}} .
$$

Many functional equations.
I got one bivariate fneqn to work.
Solutions are mod $\mathrm{P}^{3}-1$ or $7\left(\mathrm{P}^{3}-1\right)$. $\mathrm{P}=5 \ldots 17$

Higher polylogs:
Not clear if multivariate fneqns exist after 6.
Relations of rational arguments exist for all orders.

## Questions

Is this real?
Some unpublished partial results of Weibel. P <= 59 for related problem - Keith Dennis
Why does it exist?
Simpler functions +-*/ exp log trig hyp ellfn can be reduced to counting.
This floats like Laputa.

How to calculate them?
More complicated version of dlog method?

How extensive is it?

# Counting PolyHypercubes

## PolyPolygons

with Dean Hickerson

No symmetries removed: Position Orientation Reflection

> Exact algebraic coordinates of polygons $$
\text { as polynomials in } \mathrm{w}=\mathrm{e}^{2 \mathrm{pi} i / n}
$$

Floating point approximation as first cut for position determines coarse overlap.

Close cases are resolved by exact computation.

## Interesting Special Cases

Edges can meet exactly, but offset sideways.
Bare vertices can touch.
Possible centers are dense in the plane.

## PolyPolygons of side S and area A

## PolyPolygons of side S and area A

## Ratios

| Number of Sides | Estimated Ratio |
| :---: | :---: |
|  |  |
| 3 | 3.04 |
| 4 | 4.07 |
| 5 | 5.84 |
| 6 | 5.19 |
| 7 | 5.96 |
| 8 | 7.34 |
| 9 | 9.07 |
| 10 | 10.17 |
| 11 | 11.86 |
| 12 | 11.25 |
| 13 | 11.98 |
| 14 | 13.29 |

## Checkability

There are a few possible consistency checks. The Area must divide twice each value. In some cases, the number of Sides must divide the value.

The values for polyiamonds, polyominoes, and polyhexes match the Sloane database.

Two different strategies for doing the counting agree, when both exist.

But I really need independent confirmation.

## Extrapolation

We need better tools for extrapolating bumpy sequences.

Challenge:
Extrapolate Partition Numbers

$$
P(n)=1,1,2,3,5,7,11, \ldots
$$

# What is the Simplest Unsolvable Problem? 

$3 \mathrm{~N}+1$ problem doesn't count - we know the answer, even if we can't prove it.

## Here's a possibility . . .

# The Post Tag Problem 

with Allan Wechsler

Start with a bit string, and apply this simple rule to it, over and over.
Remove the first three bits, and append 00 or 1101, depending on the first removed bit.

$$
\begin{array}{ll}
0 x x ~ \$ ~-->~ \$ ~ 00 ~ & =\$ A \\
1 x x ~ \$ ~-->~ \$ ~ 1101 & =\$ B
\end{array}
$$

1001
11101
011101

# What happens to the bit string? 

It may grow.
It may shrink.
It will probably do some of both..
It could eventually vanish entirely.
It may eventually repeat itself.
Could it grow to infinity?
Could it simulate a Turing Machine?
More complex Tag systems can.

## Looping Strings

$$
\begin{array}{lll}
0 x x & --> & 00 \\
1 x x & --> & \text { A } \\
1101 & =B
\end{array}
$$

$\mathrm{AB}=001101=0 \mathrm{xx} 1 \mathrm{xx}$--> AB
BBAA --> BBAA
(AB v BBAA)* --> same
AABBB (AAABBB)* displaced; $1 / n-$ eps passes

## Three New Looping Patterns

| Period 40 | $\mathrm{~B}^{3} \mathrm{~A}^{5} \mathrm{~B}^{5}$ | $\sim 3$ passes |
| :--- | :--- | :--- |
| Period 66 | $\mathrm{AB}^{2} \mathrm{AB}^{3} \mathrm{~A}^{3} \mathrm{~B}^{3} \mathrm{~A}^{2} \mathrm{~B}^{2} \mathrm{~A}^{4} \mathrm{~B}^{2}$ | $\sim 3$ passes |
| Period 282 | $\mathrm{AB}^{3} \mathrm{ABABA}^{2} \mathrm{~B}^{2} \mathrm{AB}^{9} \mathrm{~A}^{2}$ | $\sim 11$ passes |

Each Looper can have copies of the Full Loop appended
$B^{3} A^{5} B^{5}\left(B^{2} A B A^{5} B^{3} A B^{3} A^{6} B^{2} A B A B^{3} A^{5} B^{5}\right) *$ is also period 40

Some short patterns grow very, very, very long.

| Starting Length (Letters) | Maximum Steps * | Longest Intermediate String |
| :---: | :---: | :---: |
| $1-2$ | 12 | 6 |
| $3-4$ | 28 | 16 |
| $5-6$ | 412 | 56 |
| $7-10$ | 2678 | 176 |
| $11-14$ | 25006 | 648 |
| $15-16$ | 364 K | 2078 |
| $17-22$ | 367 M | 59468 |
| $23-24$ | 2.7 G | 138056 |
| $25-26$ | $>15 \mathrm{G}$ | $>900000$ |

If there *is* a TM simulation, there should
be some simple patterns that grow linearly.
Maybe, just around the corner?

## A Boolean Quickie -Minimal Circuits for Simple Functions

We want the minimum number of gates to synthesize Boolean functions with a few inputs and one output. To simplify things, we make up some rules:

Only two kinds of logic gates: NOT(x), and Two-Input AND(x,y)
AND gates cost $\$ 1$ each. NOT gates are free.
Circuits can't have any feedback loops - they must be DAGs.
Fanout is free.
We don't care about delay time through the circuit.
We don't care about area, crossing wires, or power.

## Minimal Circuits: Functions of 0 -- 3 Variables

Variables Function Gates

| $0:$ | 0 | 0 |
| :--- | :--- | :--- |
| $1:$ | A | 0 |
| $2:$ |  |  |
|  | A\&B | 1 |
|  | A x B | 3 |

Variables Function Gates

3: A\&B\&C 2
$\mathrm{A} \&(\mathrm{BxC}) \quad 4$
$\mathrm{A}=\mathrm{B}=\mathrm{C} \quad 5$
$\begin{array}{ll}A \&(B v C) & 2 \\ (A x B) \&(A v C) & 4 \\ A+B+C=1 & 6\end{array}$
$\mathrm{Ax}(\mathrm{B} \& \mathrm{C}) \quad 4$
A(B,C) 3
$\operatorname{Maj}(A, B, C) \quad 4$
AxBxC 6

## 4 Variables

$2^{16}=65536$ truth tables
After permuting the inputs, and complementing any of the inputs and perhaps the output, there are 222 distinct functions. 208 use all four inputs.

| Number of gates: | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of functions: | 5 | 5 | 23 | 28 | 61 | 45 | 37 | 4 |

The Four Hardest Boolean Functions of 4 Variables

ABCD is $3 \mathrm{~N}+1$

$\mathrm{A}+\mathrm{B}+\mathrm{C}+\mathrm{D}=0$ or 2

ABCD is 0 or $3 \mathrm{~N}+1$

Full Adder: A selects bit of $B+C+D$

## Guesses for 5 Variables

$2^{32}=4,294,967,296$ truth tables.
616126 different functions.
Maximum gates provably <=23; I'm guessing 16 really.
Computing effort huge - Need better methods.
My search on 4 gates takes 30x for each additional gate.

## UltraPrecision

with Bill Gosper \& Eugene Salamin
Independent work by Richard Brent, and the Chudnovsky Brothers

999,999,999,999 places of Pi on the Disk, 999,999,999,999 places of Pi;

Take one down and spin it around, 999,999,999,998 places of Pi on the Disk.

999,999,999,998 places of Pi on the Disk,

## Ultracomputable Numbers

A number is Ultracomputable if the first N bits beyond the decimal point can be computed in time $\mathrm{Tk}=\mathrm{O}\left(\mathrm{N} \log \mathrm{N}^{\mathrm{k}+e p s}\right)$.
A function is Ultracomputable when its values are Ultracomputable.

+ and - are T0
* and / and sqrt and inverse functions are T1

Sqrt(2) is T1
Pi and e are T2
log and exp and $\wedge$ and trig and elliptic fns and radix conversion are T 2
gamma, zeta(3), G, Jo(z) and solns of simple Diff Eqns are T3
(simple: sum $\mathrm{P}(\mathrm{X}) \mathrm{Y}^{(\mathrm{n})}=0$, algebraic coefficients)
Gamma(algebraic) is T3
Walking Riemann surface adds 1 to k, per step.

# Extending the set of Ultracomputable Numbers 

To include the values of integrals, and solutions of differential equations.

We approach integrals with an N-point Simpson’s Rule, expecting $\mathrm{O}(\mathrm{N})$ bits.
For differential equations, we use a similar method, noting that the various corrections are all linear functions of earlier integration errors.

# Computing the Coefficients for a Generalized Simpson’s Rule 

VSC * Vandermonde Matrix $=[11 / 21 / 31 / 4 \ldots 1 / n]^{T}$

The Vandermonde Matrix can be factored into sparse invertible matrices, and moved to the other side of the equation.

The integral we want is VSC * $[\mathrm{F}(0) \mathrm{F}(1) \ldots \mathrm{F}(\mathrm{N})]^{\mathrm{T}}$. VSC need not be explicitly computed.

## Conway's Game of Life -- Highlights

- Stable Objects Counts
- Ratio
- Glider Synthesis
- Spaceship Speeds \& Directions
- Synthesis of Spaceships with Gliders
- Oscillator Periods
- Synthesis of Oscillators
- Replicator Work
- Soups: Final densities
- Life is Local in Random Soup
- Low Density Life

## Number of Stable Life Objects*

| Population | Objects | Population | Objects |  |
| :---: | ---: | :--- | :---: | ---: |
| 4 | 2 |  | 15 | 1353 |
| 5 | 1 |  | 16 | 3286 |
| 6 | 5 |  | 17 | 7773 |
| 7 | 4 |  | 18 | 19044 |
| 8 | 9 | 19 | 45759 |  |
| 9 | 10 | 20 | 112243 |  |
| 10 | 25 |  | 21 | 273188 |
| 11 | 46 |  | 22 | 672172 |
| 12 | 121 |  | 23 | 1646147 |
| 13 | 240 |  | 24 | 4051711 |
| 14 | 619 |  |  |  |

*CORRECTED!
Ratio $=\sim 2.45$

Spaceship velocities:
orthogonal: $1 / 2,1 / 3,1 / 4,1 / 5,2 / 5,1 / 6,2 / 7,17 / 45(p l a n)$
diagonal: $\quad 1 / 4,1 / 5,1 / 12$

Oscillator Periods:
everything except 19, 23, 31, 34*, 37, 38, 41, 43, 51*, 53

Random soup final density: ~ 2.8\%
weak dependence on starting probability
Locality: Wholesale changes propagate about 500 cells

## Life is Local - At Least in the Soup

Experiment:
Two 8K x 8K random starting positions ( $\mathrm{P}=50 \%$ ).
Left Halves match; Right Halves completely different.
Run both patterns.
How far does the "difference front" propagate to the Left?
After 20K steps, the furthest DF propagation is 566 cells.
The average DF propagation (over all rows) is 290 cells.
$90 \%$ of the propagation was in the first 5 K steps.
$99 \%$ was in the first 10 K steps.

## Is ALL of Mathematics Experimental?
