#### Abstract

Although many series exist for $\pi$ and $\pi^{2}$, very few are known for $\pi^{3}$. In this article, we derive, using a trigonometric identity obtained by Euler, two representations of $\pi^{3}$ involving infinite sums and the golden ratio. The methodology can be generalized in order to obtain further series, relating by the way $\pi^{3}$ to other mathematical constants.

## 1 Introduction

Many series exist for $\pi$ and $\pi^{2}$ [1]3. However, there are only very few published expressions for $\pi^{3}$. Besides the understanding of such a scarcity from the mathematical point of view and the derivation of summations in order to point out connections between mathematical constants, $\pi^{3}$ is encountered in physics for instance in the expression of the equivalent of the effective area (used for electromagnetic antennas) for gravitational-wave antennas, which is a measure of the antenna's ability to gather energy from the incident wave [4,5]. In Ref. [6], Sun mentions that the only well-known series for $\pi^{3}$ is the following one

$$
\begin{equation*}
\pi^{3}=32 \sum_{k=1}^{\infty} \frac{(-1)^{k}}{(2 k+1)^{3}} \tag{1}
\end{equation*}
$$

and in 2010 [7], the same author suggested that

$$
\begin{equation*}
\sum_{k=0}^{\infty} \frac{\binom{2 k}{k}}{(2 k+1)^{3} 16^{k}}=\frac{7 \pi^{3}}{216}, \tag{2}
\end{equation*}
$$

which was proven later [8]. In the latter paper, Pilehrood and Pilehrood obtained the following Apéry-like series:

$$
\begin{equation*}
\pi^{3}=32 \sum_{k=0}^{\infty} \frac{\binom{2 k}{k}}{16^{k}(2 k+1)^{3}}-24 \sum_{k=0}^{\infty} \frac{\binom{2 k}{k}}{16^{k}(2 k+1)} \sum_{m=0}^{2 k-1} \frac{1}{(2 m+1)^{2}} . \tag{3}
\end{equation*}
$$

In the above mentioned article [6], Sun derived the following expression

$$
\begin{equation*}
\sum_{k=1}^{\infty} \frac{2^{k} H_{k-1}^{(2)}}{k\binom{k k}{k}}=\frac{\pi^{3}}{48} \tag{4}
\end{equation*}
$$

where $H_{n}^{(2)}$ denotes, for $n \in \mathbb{N}^{*}$, the Harmonic number

$$
\begin{equation*}
H_{n}^{(2)}=\sum_{k=1}^{n} \frac{1}{k^{2}} . \tag{5}
\end{equation*}
$$

Gupta published new series representations of $\pi, \pi^{3}$ and $\pi^{5}$ in terms of Euler numbers and $\pi^{2}$, $\pi^{4}$ and $\pi^{6}$ in terms of Bernoulli numbers [9]. He found the following relation

$$
\begin{equation*}
\pi^{3}=\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{(2 n-1)^{3}\left(2^{2 k+2}-1\right)} 2^{2 k+4}(2 k+3)!\sum_{j=0}^{k}\left[-\frac{1}{(2 n-1)^{2} \pi^{2}}\right]^{j} \frac{1}{(2 k-2 j+1)!} \tag{6}
\end{equation*}
$$

where $j, k$ are integers and $\geq 0$. Following his success in discovering a new formula for $\pi$, Simon Plouffe [10-12] postulated several identities which relate either $\pi^{m}$ or $\zeta(m)$ to three infinite series. Letting

$$
\begin{equation*}
S_{n}(r)=\sum_{k=1}^{\infty} \frac{1}{k^{n}\left(e^{\pi r k}-1\right)}, \tag{7}
\end{equation*}
$$

the first two examples are

$$
\begin{gather*}
\pi=72 S_{1}(1)-96 S_{1}(2)+24 S_{1}(4)  \tag{8}\\
\pi^{3}=720 S_{3}(1)-900 S_{3}(2)+180 S_{3}(4) . \tag{9}
\end{gather*}
$$

In the present work, we show that using a trigonometric series obtained by Euler and involving the functions $x \longmapsto \cot x$ as well as $x \longmapsto \operatorname{cosec} x=1 / \sin x$, it is possible to derive series expansions for $\pi^{3}$. We present two of them which are of particular interest since they involve the golden ratio.

## 2 New series for $\pi^{3}$ involving the golden ratio

In the book by Borwein and Borwein [1], the following formula, due to Euler

$$
\begin{equation*}
\pi^{3}\left[\cot (\pi x) \operatorname{cosec}^{2}(\pi x)\right]=\sum_{n=-\infty}^{\infty} \frac{1}{(x-n)^{3}} \tag{10}
\end{equation*}
$$

is presented (13.b, p. 382). It can be used to derive series expansions for $\pi^{3}$. In particular, for $x=1 / 5$ or $x=1 / 10$ for instance, it is possible to obtain expressions of $\pi^{3}$ as series multiplied by a coefficient involving the golden ratio. Indeed, let us consider first the case $x=1 / 5$. One has

$$
\begin{equation*}
\cos \left(\frac{\pi}{5}\right)=\frac{\phi}{2} \tag{11}
\end{equation*}
$$

and

$$
\begin{equation*}
\sin \left(\frac{\pi}{5}\right)=\sqrt{\frac{5-\sqrt{5}}{8}} \tag{12}
\end{equation*}
$$

where

$$
\begin{equation*}
\phi=\frac{1+\sqrt{5}}{2} \tag{13}
\end{equation*}
$$

is the golden ratio. One thus has

$$
\begin{equation*}
\cot \left(\frac{\pi}{5}\right)=\frac{\sqrt{2} \phi}{\sqrt{5-\sqrt{5}}}=\frac{\phi}{\sqrt{3-\phi}} \tag{14}
\end{equation*}
$$

and

$$
\begin{equation*}
\operatorname{cosec}\left(\frac{\pi}{5}\right)=\frac{2 \sqrt{2}}{\sqrt{5-\sqrt{5}}}=\frac{2}{\sqrt{3-\phi}} \tag{15}
\end{equation*}
$$

Therefore, using Eq. (10) for $x=1 / 5$ yields

$$
\begin{equation*}
\pi^{3}=\frac{125}{4} \frac{(3-\phi)^{3 / 2}}{\phi} \sum_{n=-\infty}^{\infty} \frac{1}{(1-5 n)^{3}} . \tag{16}
\end{equation*}
$$

In the same way, setting $x=1 / 10$, a similar expansion can be deduced. One has indeed

$$
\begin{equation*}
\cos \left(\frac{\pi}{10}\right)=\frac{\sqrt{10+2 \sqrt{5}}}{4}=\frac{\sqrt{2+\phi}}{2} \tag{17}
\end{equation*}
$$

and

$$
\begin{equation*}
\sin \left(\frac{\pi}{10}\right)=\frac{1}{2 \phi} \tag{18}
\end{equation*}
$$

yielding

$$
\begin{equation*}
\cot \left(\frac{\pi}{10}\right)=\phi \sqrt{2+\phi} \tag{19}
\end{equation*}
$$

as well as

$$
\begin{equation*}
\operatorname{cosec}\left(\frac{\pi}{10}\right)=2 \phi \tag{20}
\end{equation*}
$$

giving finally the expansion

$$
\begin{equation*}
\pi^{3}=\frac{250}{\phi^{3} \sqrt{2+\phi}} \sum_{n=-\infty}^{\infty} \frac{1}{(1-10 n)^{3}} \tag{21}
\end{equation*}
$$

Additional expressions can of course be obtained for other values of $x$, but only a few of them will only involve the golden ratio. As an example, using $x=\pi / 15$, one has

$$
\begin{equation*}
\cos \left(\frac{\pi}{15}\right)=\frac{1}{8}(\sqrt{30+6 \sqrt{5}}+\sqrt{5}-1) \tag{22}
\end{equation*}
$$

and

$$
\begin{equation*}
\sin \left(\frac{\pi}{15}\right)=\frac{1}{16}(2 \sqrt{3}-2 \sqrt{15}+\sqrt{40+8 \sqrt{5}}) \tag{23}
\end{equation*}
$$

which unfortunately involves $\sqrt{3} \ldots$

[^0]
## 3 Conclusion

We proposed two representations of $\pi^{3}$ involving infinite series and the golden ratio. Although the number of expressions of this type is probably rather limited, the technique can be easily applied to derive other series, relating $\pi^{3}$ to other mathematical constants. It is worth mentioning that the third power of $\pi$ finds applications in several fields of physics, such as gravitational-wave antennas, in the expression of the effective area.

[^0]:    ${ }^{1}$ For instance, using $x=1 / 4$, since $\cot (\pi / 4)=1$ and $\operatorname{cosec}(\pi / 4)=\sqrt{2}$, one gets $\pi^{3}=32 \sum_{n=-\infty}^{\infty} \frac{1}{(1-4 n)^{3}}$.
